H & B Mining's RRC-EMRI provides a solution to a long-standing issue; how to complete roller changeout when a conveyor only has access on one side.

The RRC-EMRI idler support frame offers interface connections for the roller sliding frame to fix to one side of the idler only; and a vertical fixing cleat to keep the idler in its vertical operational position. Once the bolts are removed from these interfaces, the roller support frame can be rotated away from the belt and then pulled out (retracted) to allow for access to all rollers for safe and simple roller change out. To prevent the rollers from falling out during maintenance, the roller support plates have inclined slots which hold the rollers in place while the roller frame is horizontal. Click video link.
